CASE STUDY

THREE DAYS TO A

FUTURE-READY PROPERTY

LUCI completed a full retrofit of Ameristar Council Bluffs' A/V infrastructure in under three days, modernizing a system that had run since 2012 and centralizing control on land to prepare the property for its next phase of growth.

AMERISTAR CASINO ★ HOTEL — COUNCIL BLUFFS —

OPERATOR	LOCATION	RETROFIT COMPLETED
Penn Entertainment	Council Bluffs, Iowa	Under 3 days

THE CHALLENGE

A decade-old A/V system, aging equipment, and a major casino buildout on the way.

THE APPROACH

A full retrofit in under three days, with all A/V processing relocated to the data center on land.

THE RESULT

A unified, scalable platform built for the property's next phase of growth.

> *"Well done, LUCI team! This was the best installation — so seamless."*

FACILITIES MANAGER
AMERISTAR COUNCIL BLUFFS

A proven system, a bigger future

Ameristar Council Bluffs spans a land-based casino and a riverboat. Its A/V system was based on an early LUCI design that had been operating successfully since 2012.

Even after more than a decade of daily use, the original system continued to support property operations and guest experience demands. But the property was preparing for a new chapter: a major casino buildout on the land side and a planned transition away from the riverboat casino.

With years of ongoing upgrades, aging equipment, and that buildout approaching, Ameristar needed a more unified, scalable, and future-ready approach, one that could carry the property through its next phase of growth.

The riverboat at Ameristar Council Bluffs, with the land-side property beyond.

Modernize without disrupting the floor

LUCI's goal was to modernize the property's A/V foundation and position it for the transition ahead, without disrupting a floor that runs every day.

The defining move was location. As part of the upcoming transition away from the riverboat casino, LUCI relocated all new A/V processing equipment into the property's IT data center on land. Since much of the previous system's processing was located on the boat, this single move eliminated the need to design additional A/V rooms into the new buildout, helping reduce future construction and infrastructure costs.

The retrofit installation itself was completed in less than three days.

- Replaced the A/V head-end systems, amplifiers, and control infrastructure
- Relocated all new A/V processing into the property's IT data center
- Completed a full conversion and modernization of the system documentation

The result is a streamlined platform designed for years of reliable, trouble-free operation, with simplified future maintenance and expansion.

Consolidation you can see

A/V head-end and control hardware

Replaced with a LUCI stack in the land-side data center — less gear to power, cool, and maintain.

Riverboat processing rooms

Processing moved on land so the upcoming buildout does not need new A/V rooms designed into the floor plan.

Separate control workflows

Collapsed into one browser-based interface — unlimited operational users from any authorized device.

Legacy system documentation

Converted to a full LUCI modernization package the team can maintain going forward.

What the property gained

The upgraded platform gives the property unlimited operational users through any browser-based device — greater flexibility, broader delegation, and faster response to daily needs.

Built-in automation lets the team perform daily resets, scheduled adjustments, and system-wide changes with less hands-on intervention.

And because LUCI's evolving feature set arrives without additional upgrade licensing, the platform grows alongside the casino's future needs.

01 One unified view of every endpoint	02 Broader delegation by zone	03 Faster response to daily needs
04 Automated resets and scheduling	05 Simpler maintenance and expansion	06 Lower long-term infrastructure costs

Video endpoints	Audio zones	DTV channels	CMS/signage channels

One LUCI platform

Every endpoint, every zone, every channel — one interface.

Built for the moves ahead

With the system centralized on land, the property is set up for what comes next.

- ✓ **The boat can sail.** When the time comes, Ameristar can step away from the riverboat as a clean break, and keep running on LUCI.
- ✓ **The new build can plug in.** When the new construction opens, it runs on the platform already powering the property — no second install, no parallel system to stand up.
- ✓ **Future growth is built in.** As Ameristar expands, it can do so unobstructed — LUCI has removed the logistical variables and A/V complications that would otherwise pile up over time.

By modernizing the A/V infrastructure and centralizing system control, LUCI helped Ameristar Council Bluffs prepare for its next phase of growth, preserving operational reliability, improving efficiency, and reducing long-term infrastructure costs.
