

CAPABILITIES OVERVIEW

PREPARED FOR PARAGON

Platform, architecture, and embedded operation — scoped to Paragon's multimedia environment.

CLIENT SUMMARY

Paragon operates a multimedia environment spanning 2,100 slots, an entertainment center, hotel, conference center, RV resort, and golf course in Marksville, Louisiana — much of it still on coax and thumb drives, with CoolSign on a single shared PC and no desktop control over the A/V alongside Swift, Everi, and IGT. LUCI consolidates distribution and control onto one network and one accountable partner — standing behind the platform with reliable, long-term support — so every endpoint, zone, and system is managed from a single picture. This capabilities overview of the LUCI platform follows our demo, for your review and to share with your team.

PREPARED FOR

THE ORCHESTRATION ENGINE FOR ENTERPRISE MULTIMEDIA.

One interface to control, automate, and execute the entire guest experience.

WHAT LUCI IS

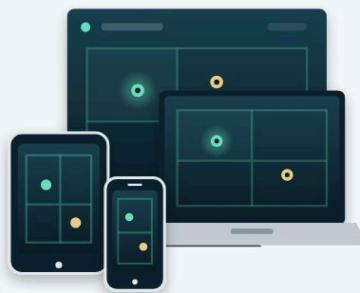

Two forces working as one.

LUCI

THE ORCHESTRATION PLATFORM

Software & minimal hardware

Systems

THE EMBEDDED OPERATION

Our team, processes, and standards

LUCI gives you fewer

VARIABLES

HARDWARE

INTERFACES

VENDORS

Bring all A/V under **one point of control.**

Every screen, source, and zone lives in one interface instead of a patchwork of tools added by integrators over the years.

Complete visibility and control across your property

One interface surfaces every endpoint, zone, and system across your property. Every team sees the same picture and acts from the same place.

Align your teams by default

LUCI connects every team to the same system, so your organization can stop negotiating internally and start executing towards a shared vision.

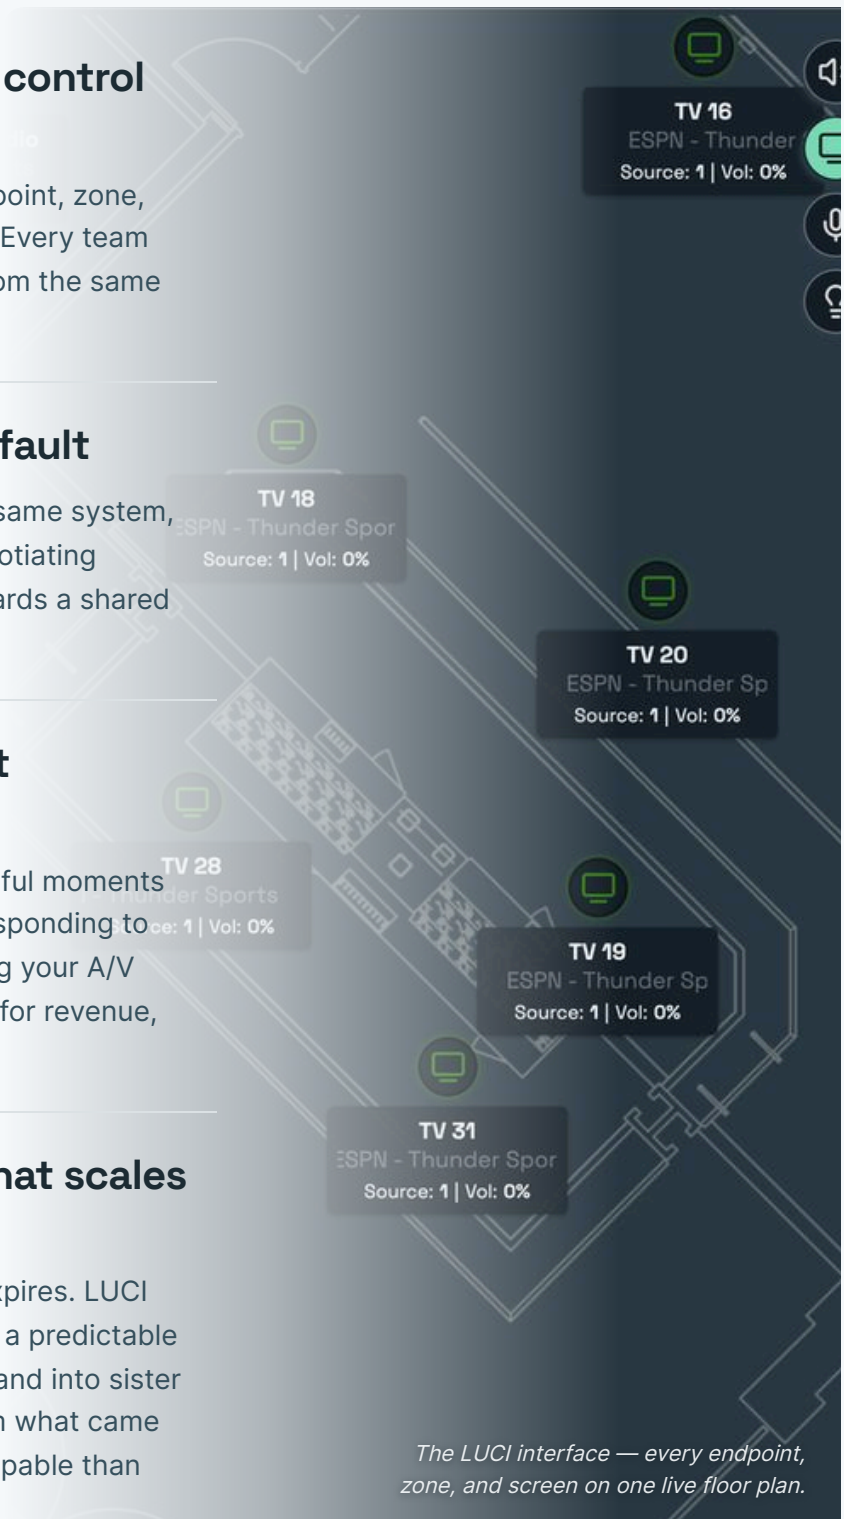

Fully activate the guest experience

Turn passive screens into purposeful moments by planning, programming, and responding to guest signals in real time — turning your A/V infrastructure into a strategic tool for revenue, retention, and brand.

Invest in the only A/V that scales and improves

Traditional A/V depreciates and expires. LUCI doesn't. We refine the platform on a predictable annual line item, so when you expand into sister properties, each one benefits from what came before — and Year Five is more capable than Year One.

The LUCI interface — every endpoint, zone, and screen on one live floor plan.

Less hardware. Fewer vendors. **Your team in control.**

80%

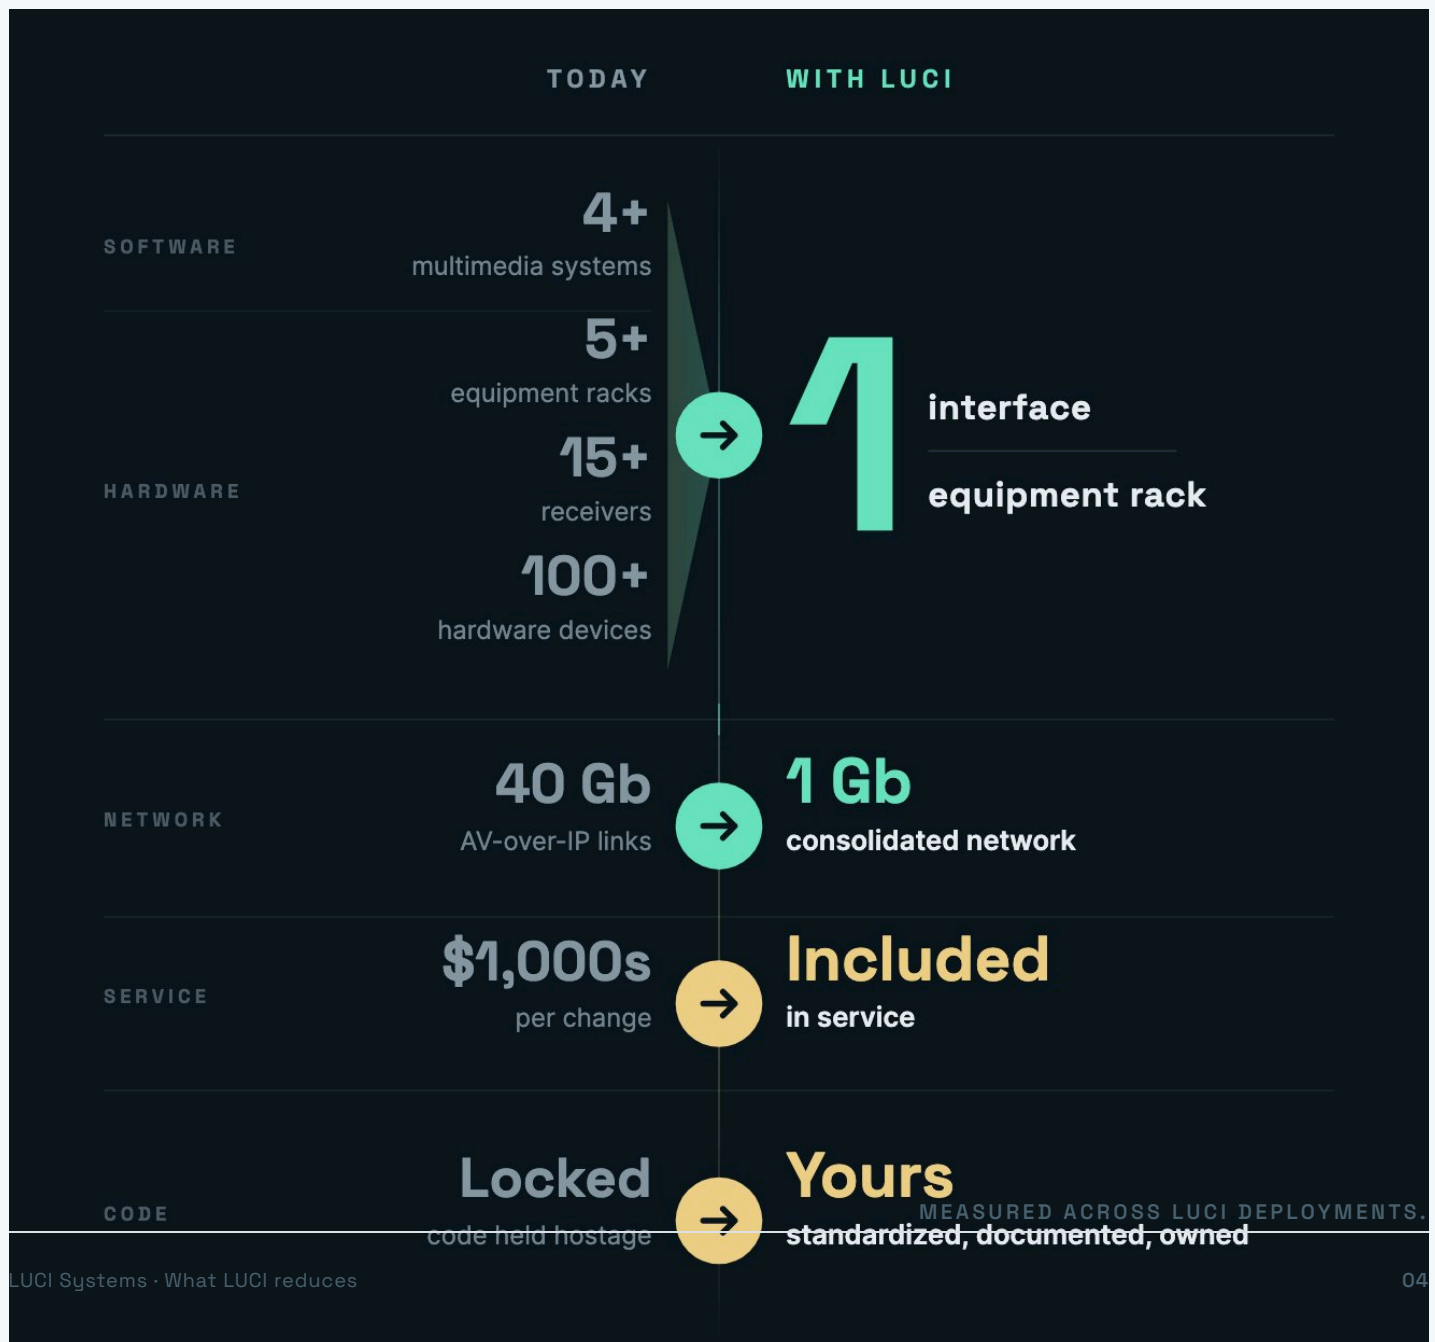

Less on-site hardware

Fewer boxes to buy, rack, power, and refresh.

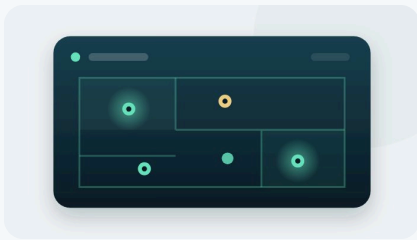

75%

More stakeholder usage

Adopted across the floor — not shelved.

Six capabilities define the platform.

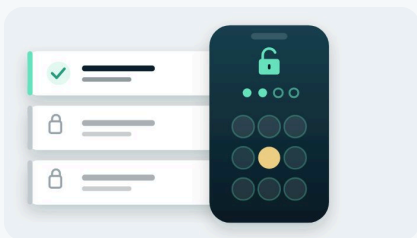

Map-based dashboard

Live visual map of every display, audio zone, and system endpoint across the property.

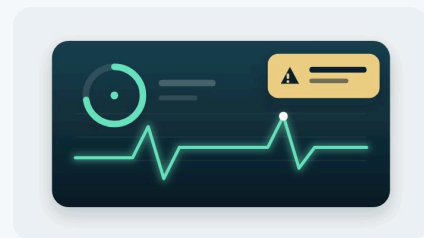

Open integration

Connects to any A/V, signage, building, or content system through open APIs — regardless of protocol, make, or model.

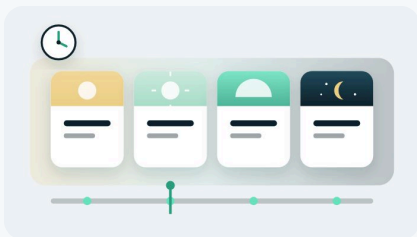

PIN-delegated control

Every user controls only their designated zones. Permissions follow roles, not device-by-device configuration.

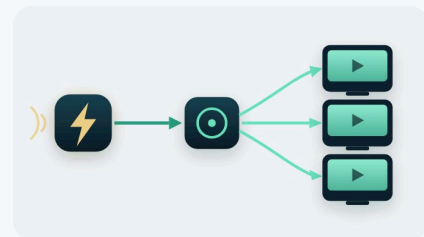

Predictive monitoring & alerts

The platform surfaces and resolves common issues automatically — before the guest notices.

Presets & scheduling

Save and schedule scenes so daily transitions run without manual intervention across every zone.

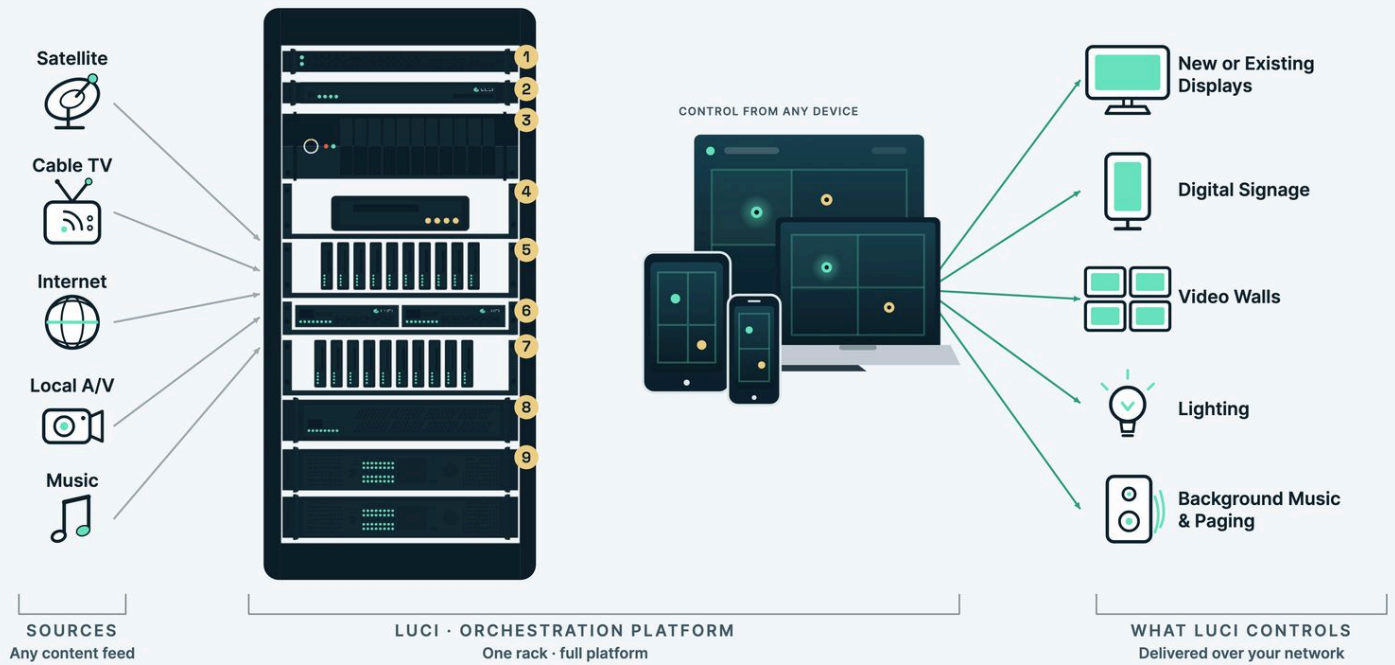

Automation & triggers

Listen for external events — jackpot alerts, player data, weather, emergency systems — and fire coordinated responses in real time.

How LUCI connects.

Sources in, the whole property out — orchestrated from one control point, over the network you already run.

RACK COMPONENTS

Standardized across every property

- 1 Network Switch
- 2 LUCI CCS Server
- 3 Satellite Video Server

- 4 Satellite RF Distribution
- 5 Digital Media Players
- 6 NX-5 IPTV Encoders

- 7 Background Music Players
- 8 Audio System Server
- 9 Audio Amplifiers

Standard network

Runs over your existing property network — no parallel infrastructure to build or maintain.

Open APIs

Documented, open interfaces integrate the systems and content sources you already run.

Minimal head end

One standardized rack replaces racks of single-purpose boxes — less to power and refresh.

The team that **fuels the platform.**

One accountable team — six named services that get you live, then stay, operating and refining LUCI for the life of the relationship.

01 LUCI FDE — Forward-Deployed Engineering

Full-stack engineers embedded in your environment, from scoping through refinement — building production systems that stay accountable after launch.

02 Design & Deployment

In-person scoping, architecture, and stand-up by the team that stays — phased so value lands early.

03 Owner's-Rep Partnership

A standing extension of your enterprise — in-house technology leadership for the guest-facing environment.

04 Training & Enablement

A role-based curriculum that makes your team fluent in LUCI, with documentation that lives inside the platform.

05 Support & Operations

The same team that built the platform answers when something needs attention — no tiered queue, no finger-pointing.

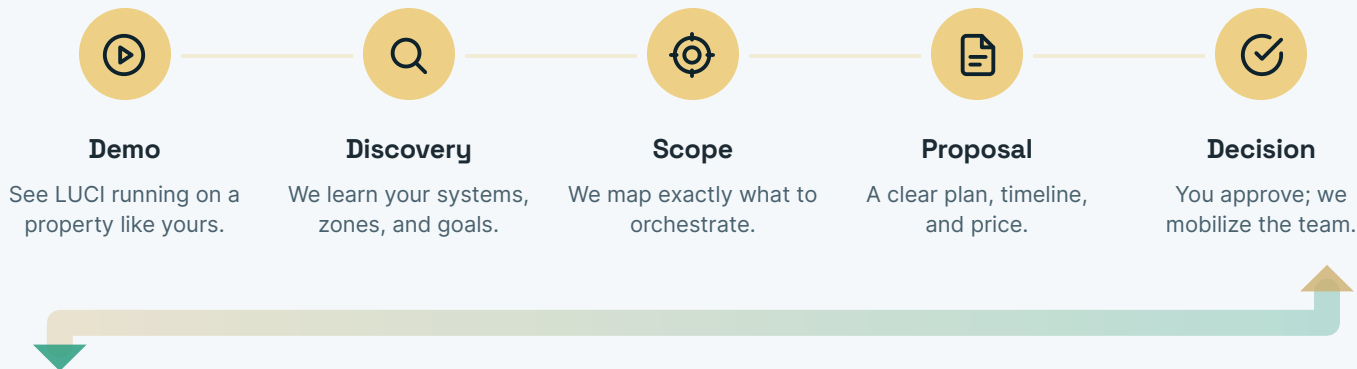

06 Continuous Refinement

Every incident becomes input to the next release — problems engineered out so no property meets them again.

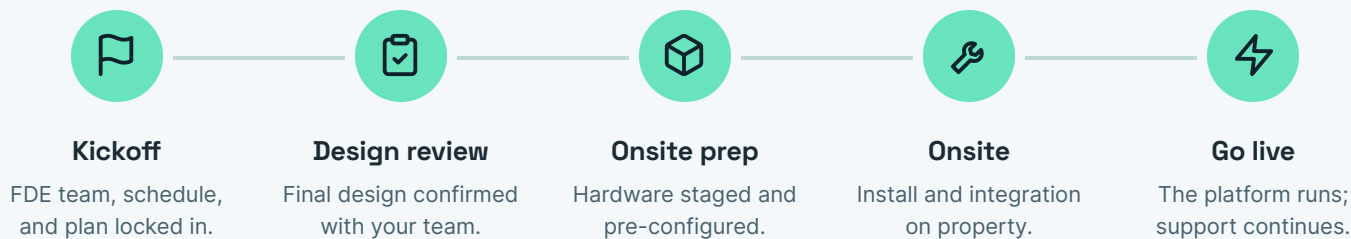

We walk you through **every step.**

From the first demo to year five, one embedded team guides the path to the right scope — then stands behind the platform for the life of the relationship.

PHASE 1 THE PATH TO THE RIGHT SCOPE

PHASE 2 DEPLOYMENT

OUR FOUR COMMITMENTS

- 

Support begins before deployment.
Every LUCI engagement starts with the FDE team embedded in the property. Support begins on day one.
- 

The team that builds your system supports it.
The engineer who walks the property on day one answers the call in year five. LUCI does not hand off engagements.
- 

One team owns every incident, end to end.
No ticket queue, no escalation path, no third party — LUCI owns diagnosis and resolution. Properties report up to **85% fewer support calls.**
- 

The platform gets more capable every day.
Continuous refinement means every release and every year adds capability — inherited by every property on the platform.

Three days to a future-ready platform.

Ameristar Council Bluffs had run a land casino and a riverboat on LUCI since 2012. Facing a major buildout and a planned exit from the boat, LUCI modernized the whole A/V foundation in one three-day retrofit — without ever taking the floor down.

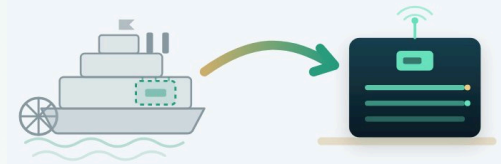

3 Days

Full retrofit,
floor never closed

AMERISTAR
CASINO ★ HOTEL
— COUNCIL BLUFFS —

THE DEFINING MOVE

Most of the property's A/V processing lived on the riverboat. LUCI moved all of it into the IT data center on land — so control is centralized, and the new buildout needs no separate A/V rooms.

"Well done, LUCI team! This was the best installation — so seamless."

Facilities Manager · Ameristar Council Bluffs

WHAT'S NOW POSSIBLE

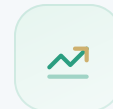

The boat can sail

Control lives on land, so Ameristar can retire the riverboat as a clean break and keep running on LUCI.

The new build plugs in

New construction runs on the platform already powering the property — no second install.

Growth is built in

The property keeps expanding without the A/V complications that pile up over time.

TRUSTED WHERE DOWNTIME ISN'T AN OPTION

NEXT STEP

A PROPERTY THAT GETS SIMPLER AS IT GROWS.

Schedule a scoping session to map your multimedia environment and define a deployment path.
